

The Wind of Climate Change

Challenges and Consequences of Climate Change for Political Stability in the Balkans

Human-induced climate change is a global phenomenon that will amplify existing risks and create new risks for all natural and human systems. The Balkan peninsula appears to be among the regions under higher risk from both natural and socio-economic consequences of this adverse process. This special report examines the political and economic risks associated with climate change - and identifies opportunities - for the countries of the Western Balkans. It further describes possible scenarios for the future, based on current political, economic, social and environmental trends.

Publication Date: 5th April 2018
